Inhalte

Human intelligence manifests itself through a number of highly specialized but interrelated competences and skills. Assuming that the basis for these abilities is an extraordinary well-organized associative memory, information and knowledge modeling takes on a special position for Strong Artificial Intelligence also called Artificial General Intelligence (AGI).

A lot of commercial software systems use basic information modeling techniques, like Entity Relationship Diagrams (ERD) or Uniform Modelling Language (UML), which has strengths but also weaknesses. Some techniques are designed to model more dynamical events like the Business Process Modelling Language (BPML). Further developed modeling techniques are used to describe information in a more sophisticated way and even used to model knowledge represented in computer systems and AI systems. One example is the Knowledge Modeling and Description Language (KMDL).

This course provides three main topics:

- a) The phenomenon of data, information and knowledge and advanced approaches to structure information for intelligent systems.
- b) The modeling of different aspects like time and space within that information models in different ways.
- c) Development of a custom modeling language providing an orthogonal integration of the discussed aspects.
- d) Implementing of parsers to compile the languages into adequate information and knowledge structures.

The learned techniques are used to model the dynamic movement of a robot within a room with no coordinate system, but only based on relative and spontaneously received position information of detected items.

Lernergebnisse

Understanding what information is and how common information modeling languages work. Apply that languages for special situations. Analyse the structure of modeling lanugages regarding the value for intelligent systems. Create a individual information and knowledge modeling language. Create a parser for that language. Create a description for freely moving robots.

Inhalte

The course is structured as a series of shark-tank events with founders, investors and developers that estimate current progress of the team and decide if the team can work further on the current project or has to pivot.

As the course progress we cover following topics:

- 1 What is venture capital?
 - a brief history of venture investment
 - probabilistic approach to venture investment
 - venture capital as innovation driver
 - Pareto-principals
- 2 What is a product?
 - Why is technology not a product?
 - Paper prototyping and product market fit
 - Customer development cycle
 - Product-market fit
 - Minimal Viable Prototype
 - Price and value: elasticity, supply, demand, branding
- 3 What is a pitch deck?
 - What are the key structural components of a good pitch?
 - Principles of storytelling
 - Unique selling proposition
- 4 How to manage people?
 - Managing small teams
 - Trade-off between discipline and creativity
 - Motivation, empathy and discipline
- 5 What is your go-to-market strategy?
 - Customer acquisition costs
 - Lifetime value
 - Distribution channels and partnerships
 - Data-driven marketing

Lernergebnisse

- Students the core principles of technological entrepreneurship and build a technologic business from scratch
- Students create and validate a customer development pipeline
- Students evaluate product market fit and unit economics of the technological product
- Students create a pitch deck for their project from scratch, evaluate the quality of the early-stage venture capital, and know how to implement a fund-raising plan
- Students create a Minimal Viable Prototype (MVP) by applying principles of paper prototyping and using frameworks for customer development
- Students understand the overall properties of venture capital markets and pitch their project to actual VCs.

Affinität zu technischen Anwendungen

Inhalte

This course provides a hands-on introduction to the field of autonomous systems. Using the NVIDIA Jetson platform, students will develop a self-driving car capable of completing laps on a race track by adjusting its speed, controlling its steering, and detecting traffic signs using a vehicle-mounted camera.

Each session is divided into a 60-minute block covering the relevant technical foundations, followed by a 120-minute practical block in which students apply and implement the concepts introduced. The course approaches autonomous driving from both a computer vision perspective (including camera representations, centreline extraction, and speed/steering control) and a data-driven point of view (including supervised learning, residual/convolutional neural networks, and object detection).

Students will work in teams throughout the course. The course concludes with a friendly competition in which the teams put their autonomous vehicles to the test, competing for fast lap times and accurate predictions.

Lernergebnisse

After successfully completing this course, students will be able to:

- explain fundamental concepts and key challenges of autonomous systems;
- collect, preprocess, and analyze sensor data for training and evaluating data-driven models;
- apply computer vision algorithms for camera-based vehicle control;
- apply deep neural networks to perception and control tasks;
- evaluate the performance and limitations of different approaches to autonomous system design.

Empfohlene Voraussetzungen

basic familiarity with Python

Inhalte

1. Logical Approaches [1]

- Semantics and syntax of Propositional Logic
- Logical inference algorithms
- Neural function decomposition and inference

2. Probabilistic Approaches [2]

- Independencies, Graphical Models and Sufficient Statistics
- Reasoning schemes and maximum likelihood estimation
- Causal models and inference

3. Statistical Models of Knowledge Graphs [3]

- Knowledge Graphs, Description Logic and Semantic Web Standards
- Query languages for inference
- Statistical Relational AI

4. Quantum Machine Learning [4]

- Circuit model of computation and measurement schemes
- Deutsch-Jozsa Algorithm and application in Neuro-Symbolic AI
- Quantum advantages in sampling and contractions

All concepts will be introduced in a unifying tensor network formalism [5], which will be developed sequentially during the course.

The topics are accompanied by demonstrations and exercises based on the python library tnreason.

Lernergebnisse

Students will

- understand the challenges of robustness and explainability to be addressed in the next generation of AI
- be familiar with frameworks to implement neuro-symbolic models
- get a strong background in the logical and probabilistic foundations of AI
- be trained on the Python library tnreason towards conducting independent research projects

Successful students will be invited to join the tnreason development community and pursue a Master's Thesis in collaboration with the Weierstraß Institute.

Inhalte

- Artificial neural networks (ANN) in machine learning (ML)
- Basic concepts of learning algorithms and typical tasks
- Model development workflow, hyperparameter tuning, performance measures and model selection
- Ethical and societal aspects (open access, data governance, fairness, transparency, reproducibility, safety and robustness, interpretability and human oversight/trust, ecological footprint)
- Basic ANN architectures
- Multilayer perceptron (feed forward)
- Convolutional neural networks
- Attention
- ANN model regularization
- Norm penalties
- Data augmentation
- Early stopping
- Dropout
- ANN model optimization
- (Stochastic) gradient descent
- Backpropagation
- Momentum methods
- Learning rate scheduling
- Major ANN applications and selected advanced models
- Computer vision (object detection, image classification, style transfer)
- Natural language processing (word2vec, BERT)
- Autoencoders
- Generative models
- Deep learning software packages
- PyTorch

Lernergebnisse

Upon completion of the module students:

- can place artificial neural networks within the broader area of machine learning, understand their major advantages and disadvantages, and are aware of major applications of ANN as well as selected advanced models under research and their fundamental ideas
- understand and assess the critical differences between the basic ANN architectures (MLP, CNN), can implement them in standard deep learning software packages, and can train, test, and evaluate the ANN models over real data
- building on the experience of working with their own ANN implementations, can reuse publicly available implementations of more complex models to carry out experiments over real datasets, can compare the performance of these across various models and their hyperparameter setups
- understand the importance of transparency and reproducibility in deep learning experimentation and can present in written as well as oral their learning and evaluation pipeline including relevant description of the selected software and hardware configuration
- are aware of the ethical and societal impacts of machine learning and deep learning and can critically assess deep learning reports along these lines

Knowledge in programming (Python) and mathematics (linear algebra, probability theory, multi-variable calculus).

Inhalte

This course provides a comprehensive introduction to the field of machine learning. Starting from basic principles, we are going to develop a data-driven framework that allows us to express representation and prediction tasks as learning problems, either supervised or unsupervised.

In both cases, our discussion of the relationship between data and model will lead to a broad spectrum of approaches with different properties: linear vs. non-linear, parametric vs. non-parametric, deterministic vs. non-deterministic, and classification vs. regression. We are going to explore how these models are formulated, how they can be optimized, and how they can be applied to new data.

In a parallel track, we are going to explore theoretical properties of machine learning models, including their robustness, complexity, and meta-level behaviour.

In particular, the course covers the following topics:

- Data: collection & representation
- Data: statistical & visual exploration
- (Linear/Probabilistic/Non-parametric) classification
- (Linear/Non-Linear/Robust) regression
- Meta learning: ensembling & boosting
- Clustering
- Outlier Detection
- (Stochastic) gradient descent
- (Feature/Model) selection
- Regularization
- Convolutions
- Kernel Trick
- Maximum likelihood & maximum a-posteriori
- Principal component analysis
- Gaussian processes
- Multi-dimensional scaling
- Neural networks & deep learning

Lernergebnisse

Upon completion of this module the students have a broad understanding of machine learning and its subfields, including the following:

- They can independently collect/analyze data and take the necessary steps to prepare them for learning and inference tasks.
- They are familiar with a variety of supervised/unsupervised models and understand their principles and properties.
- They can select an appropriate model for a given task and design, implement, optimize, run, and analyze the corresponding machine learning pipeline.
- They understand the balance between expressiveness and generalization. They are able to employ selection, regularization, and meta-learning techniques to maximize model performance.

Lernergebnisse

- Students refresh and develop further their knowledge and skills on the necessary mathematical foundations for understanding and developing algorithms for AI; in particular, linear algebra, calculus, probability.
- Students understand the principles of continuous optimization (constrained and unconstrained), are able to select appropriate approaches and they apply them for problems in AI.
- Students are able to apply and evaluate the principles of probabilistic modelling and inference, and they create probabilistic models for frequently occurring kinds of data.
- Students use the acquired mathematical skills to design and create frequently occurring building blocks of AI systems, such as linear regression, PCA, Gaussian mixture models and support vector machines.

Inhalte

The course is composed of 2 thematic blocks.

Block A: Reinforcement Learning

1. Basic Reinforcement Learning Concepts

- Actions and States
- Goals, Rewards, Returns and Episodes
- Policies and Value Functions

2. Basic Reinforcement Learning Methods

- Finite Markov Decision Processes
- Dynamic Programming
- Monte Carlo Methods

3. Advanced tabular learning Methods

- Temporal-Difference Learning
- Bootstrapping Methods

4. Learning in Continuous State and Action Spaces

- On-Policy Approximation
- Value-function Approximation
- Off-Policy Approximation
- Approximate Eligibility Traces

5. Value Function Approximation Case Studies

- Computer Vision: Action planning
- Mastering Games: Backgammon, Go

6. Applications and Exercises

Block B: Sensor Fusion

1. Using Bayes for Sensor Data Fusion

- Modeling and Estimation of Densities
- Sensor Fusion over Time

2. Hidden Markov Models and Viterbi Algorithm

3. Recursive State Estimation

- Gaussian Filters
- Nonparametric Filters

4. Applications

Lernergebnisse

- Students develop further knowledge and skills on the necessary mathematical foundations for understanding and developing algorithms for AI.
- Students can apply the principles of Reinforcement Learning algorithms
- Students can use the principles of modelling agents, environments and rewards.
- Students understand the necessity of function approximations in learning.
- Students understand the concepts of statistical sensor fusion
- Students can realize sensor fusion applications
- Students build on their acquired knowledge to master learning problems.

Inhalte

Studying and working in Germany

- THWS study system, MAI program and structure, examination rules, SPO, APO
 - getting a job in Germany, support structures in THWS, academic CV, networking options
 - academic good conduct, plagiarism rules, use of AI
- Practical research and scientific work skills and principles of good scientific conduct.
- Academic writing on AI topics in English (for non-native speakers)
 - Standard structure of academic texts – project proposal, theses, technical reports, research articles
 - Specific grammar features and word choices of English academic text and common pitfalls for non-native speakers
 - Literature review (dblp, google scholar, journals and conferences, predatory publishers)
 - Visual support of technical text (visual display of quantitative data, visual communication), academic presentations and poster design
 - Analysis of academic text, critical evaluation, peerreview process and principles
 - Academic and research support software tools and bibliography systems (Zotero, Mendeley, ...)
 - Academic talk structure, audience targeting, academic exchange of knowledge and experience, constructive feedback and academic research discussion
 - Good conduct in academic writing (citations, acknowledgments, plagiarism), open science, transparency, reproducibility

Lernergebnisse

Upon completion of the seminar students:

- can write English academic texts on AI topics taking into account the expected format (using appropriate mathematical typographical software - LaTeX), structure, and the target audience; can adapt the language and visual support accordingly (article vs. presentation, etc.).
- understand the importance of good academic conduct, the boundaries and consequences of plagiarism, and the benefits of open science, transparency and reproducibility, they can design their communication strategy accordingly (open access / open source, experimental documentation, etc.)
- can conduct relevant literature search, analyze the quality of texts, can create and maintain a relevant bibliography in standard software tools and correctly reference previous work in their academic outputs
- are aware of selected recent trends in AI research and main opportunities and challenges in transferring them to practical applications
- can critically analyse academic text and provide constructive feedback, can interact with senior researchers in an informed discussion

Inhalte

This lecture course provides a foundational and comprehensive introduction to the field of Computer Vision, covering both traditional image processing techniques and modern Deep Learning-based approaches. The focus is on understanding the theoretical principles underlying key algorithms, while also examining their applicability to real-world problems.

Students will explore the strengths, limitations, and use cases of classical methods—such as edge detection, feature extraction, and image segmentation—as well as state-of-the-art machine learning techniques, including Convolutional Neural Networks (CNNs) and other deep learning architectures.

A strong emphasis is placed on bridging theory and practice. Real-world examples are drawn from domains such as medical image analysis, industrial inspection, and other safety-critical applications, where factors like robustness and explainability play a central role. Concepts from Explainable AI (XAI) are discussed in the context of interpreting and validating model behavior, particularly in high-stakes environments.

Theoretical knowledge is reinforced through practical exercises and programming assignments, enabling students to implement core algorithms and develop their own solutions to defined tasks. This integrated approach supports the development of both analytical thinking and technical proficiency.

Lernergebnisse

By the end of this course, the students will be able to:

- Remember fundamental principles and key terminology related to traditional and deep learning-based Computer Vision methods.
- Understand the theoretical foundations and practical implications of major Computer Vision algorithms in various application contexts.
- Apply established Computer Vision techniques to solve basic real-world problems through programming assignments and projects.
- Analyze the strengths, limitations, and suitability of traditional versus deep learning approaches across diverse tasks.
- Evaluate and compare different Computer Vision models based on performance, computational efficiency, and application constraints.
- Create adapted or novel solutions by integrating existing algorithms into practical systems tailored to specific use cases.
- Apply research-informed methodologies to bridge the gap between theoretical models and industry-level implementations.

Inhalte

01. Introduction – Nomenclature, history, state of the art, module logistics
02. Linear Algebra and Probability Primer – Vectors and operations, matrices and operations, axioms of probability, independent events, Bayes rule
03. Bayes Filter – Recursive Bayesian updating, state transitions, Markov property, derivation
04. Probabilistic Modelling – Odometry- and velocity-based motion models, beam- and scan- based sensor models
05. Localization with Nonparametric Filters – Discrete Bayes filter, importance sampling, particle filter
06. Localization with Gaussian Filters – Kalman filter, Extended Kalman filter
07. Mapping with Known Poses – Occupancy maps, reflection probability maps
08. Landmark-based SLAM – SLAM problem, EKF SLAM, loop closing, Rao-Blackwellization, FastSLAM
09. Grid-based SLAM – Scan matching, FastSLAM, improved proposals, selective resampling
10. Motion and Path Planning – Configuration spaces, combinatorial planning, search algorithms, A* with extensions, collision avoidance
11. Markov Decision Processes – MDP definition, utility, value iteration, policy iteration

Lernergebnisse

- Apply the Bayes (filter) formula and sample from probability density functions
- Determine and apply probabilistic sensor and motion models
- Discuss the steps and components of realizations of Bayes filters
- Implement realizations of Bayes filters and compute location estimates for robots
- Build and analyze grid maps
- Differentiate between localization and SLAM systems as well as outline auxiliary techniques for SLAM solutions
- Assess and implement components of landmark- and grid-based solutions to the SLAM problem
- Differentiate between different path planning techniques and discuss the steps of collision avoidance solutions
- Apply and implement graph-search techniques for path planning
- Assess the Markov Decision Process definition as well as the concepts of Utility and Policy
- Apply dynamic programming on Markov Decision Problems to compute value functions and optimal policies

Inhalte

The module introduces core ethical theories and explores key AI-related ethical challenges, such as agency, bias, data protection, democracy, job transformation, and sustainability. It examines methods and standards for integrating ethical assessment into AI development, referencing major international guidelines (EU, OECD, UNESCO, Council of Europe, G7) and the EU AI Act. Current legal debates are covered, including copyright in training data, for AI-generated content, and evolving EU liability frameworks for AI.

Overview on the content of the module:

- Ethics 101 and the traditional schools of Ethics
- Clusters of ethical challenges related to AI:
 - agency and human/machine relation
 - power and responsibility
 - biases and discrimination
 - data ownership/data protection (including basics structures of data protection law)
 - democracy, election integrity, free discourse and the problem of AI driven malinformation, disinformation and deep fakes
 - AI as catalyst of radical transformation?: job displacement/transformation of work
 - AI and sustainability
- Approaches and standards on how to integrate ethical assessment in professional workstreams/development of AI and AI applications
- Selected established international ethical guidelines and their take on these challenges: EU, OECD, UNESCO, Council of Europe, G7
- Overview on the EU AI Act: Scope, Risk based concept, Obligations, Governance Structures, Sanctions, Enforcement
- Further current legal and regulatory discussions on AI:
 - How to deal with the use of copyright protected material as training data?
 - How to deal with AI's output in terms of copyright law?
 - What's ahead: status quo of the reform of the liability regime for AI in the EU

Lernergebnisse

After completing the module, students will be able to...

- critically analyze central clusters of ethical challenges of AI, compare their effects on different areas of application and develop recommendations for dealing with these challenges
- integrate an ethical assessment in professional workstreams/AI development processes
- evaluate requirements of data protection law for AI and analyze gaps in the EU General Data Protection Regulation in the context of AI
- evaluate international guidelines on ethical AI in a differentiated manner, work out similarities and differences and formulate well-founded proposals for their implementation in their own professional environment
- evaluate basic legal requirements of the EU AI Act on AI systems and General Purpose AI-Models
- critically assess current legal debates on the use of copyrighted material as training data and the protection of AI outputs and develop and defend their own points of view
- assess AI practices based on basic structures of civil liability and have insights on the status quo of next phase of the EU's regulation of AI regarding the liability regime for AI
- communicate and cooperate better with ethical and legal professionals in their future professional environment

Mathematical Foundations of AI

Artificial Intelligence and Machine Learning

Artificial Neural Networks and Cognitive Models

Inhalte

The model is implementing a learning-by-doing approach. The students read a variety of scientific publications that are fundamental for the topic, present and discuss these contributions as the course unfolds. They participate in a Kaggle-like NLP competition as well as submit several tutorials and the final capstone project.

The course covers the following set of topics:

1. Natural Language and Semantics:
 - Introduction and Natural Language Processing Applications
 - Text and Speech Basics
 - Verbal Intelligence
 - Information theory foundations
 - Text representations
2. Research Methodology:
 - Reading scientific papers
 - Scientific reproducibility
 - Empirical Methods
3. Tokenization
 - BPE
 - Information-theoretic approach to tokenization
 - Unigram
 - Modern Tokenisation methods
4. Word Embeddings
 - Embeddings
 - Global and local Representations
 - Distributed Representations
5. Early Language Models
 - Markov Chains
 - Recurrent neural networks for text processing
 - Autoencoders
5. Foundations of Large Language Models

- Transformers
- Large Language Models
- Pretraining
- RLHF
- Other forms of fine-tuning

5. Advanced chapters of Large Language Models

- LLM bias
- LLM safety
- Agentic frameworks

Lernergebnisse

After successfully completing the module:

- students learn how to develop and apply the methods of Natural Language Processing.
- students are able to develop result-oriented applications that integrate suitable Natural Language Processing methods.
- students are able to analyse concrete industry tasks in the field of natural language processing from an RnD perspective, evaluate and select suitable methods and software components from the field of natural language processing to develop them further and fit for the suggested task.
- students organise themselves and their team independently in the application of learned methods of Natural Language Processing.

Scientific Seminar

Inhalte

This module offers MAI students a hands-on, supervised opportunity to work as a team on a small, real AI project of practical or research relevance.

Groups of three students select one of several topics proposed by FIW professors, spanning application domains such as computer vision, generative modelling, time series analysis and scientific machine learning.

Students work through the full project lifecycle: requirements analysis, literature and method review, implementation, evaluation and presentation of results.

Each project is supervised individually by the proposing professor, who determines the methodology and deliverables appropriate to the chosen topic.

Progress is reviewed through structured milestones, including a poster session, a short written report and a live demonstration of the developed prototype.

Lernergebnisse

Upon completion of the module students shall be able to analyze, plan, develop, solve and present a small AI project in a team.

Students shall be able to translate a real-world or research problem into a well-scoped technical project plan with milestones.

Students shall be able to select, implement and evaluate an appropriate AI/ML method for the chosen problem, and critically assess the strengths and limitations of their solution.

Students shall be able to collaborate effectively within a small team, distributing responsibilities and integrating individual contributions into a coherent project outcome.

Students shall be able to document and present their work professionally in written (report/poster) and oral (demo) form for technical and non-technical audiences.

Literatur

Topic- and method-specific literature provided by the supervising professor for the chosen project.

Finished the following courses with average grade ≤ 2.5 :

- Mathematical Foundations of AI
- Machine Learning
- Introduction to Deep Learning or Artificial Neural Networks and Cognitive Models

Empfohlene Voraussetzungen

excellent knowledge of probability theory basics

fluency in implementing and training neural networks in PyTorch

Inhalte

This course covers the fundamental ideas of deep unsupervised learning, generative modelling and self-supervised learning.

We will explore the main types of models for deep generative modelling, autoregressive models, flow models, latent variable models, generative adversarial networks and diffusion models.

We will discuss their motivation, mathematical description as well as their practical implementation.

We will investigate the strengths and weaknesses of the models for various tasks and data modalities.

We will put the models into the context of modern AI and establish the links to foundational models, unsupervised distribution alignment, compression and AI for science.

The course will be organized as a seminar with strong focus on independent work of the students.

Students will be expected to read recommended papers which will be further discussed in the class.

An important part of the course will be coding homeworks, where students shall implement and train the main unsupervised deep learning architectures.

Throughout the whole course students will be supported by regular discussion and Q&A sessions as well as the possibility for one-on-one consultation sessions.

Lernergebnisse

Upon completing the course students shall understand the differences between supervised, unsupervised and self-supervised learning and be able to name their primary usage and pros/cons.

Students shall be aware of the variety of possible approaches and shall be able to explain the main ideas underlying deep unsupervised learning paradigms.

Students shall understand the mathematical formulations of the models and shall be able to build on this understanding when exploring independently more complex versions of the models.

Students shall be able to implement and train the basic versions of the main deep unsupervised models, shall be able to appreciate the intricacies of implementing and training more complex versions of the models which shall enable them to design and develop their own solutions to novel problems.

Students shall be aware of classical as well as recent use-cases for the models, their challenges and strategies to tackle them, as well as of current limitations for the models.

Fundamentals in Mobile Robotics

Artificial Intelligence and Machine Learning

Reasoning and decision making under uncertainty

Inhalte

This course is aimed at those students who are interested in diving deeper into embodied artificial intelligence and robotics. While the course has several distinct topics that it will cover, the overall goal is gain a better insight how AI techniques taught in the program are being used in robotics to make robots act in intelligent ways.

Specific topics covered:

Control Architectures: Cognitive Architectures, reactive vs. proactive, policies vs. plans, subsumption architecture, task-switching policy representations (e.g. finite state machines or behavior trees which are also used to control agents in computer games),

Robot learning: imitation learning & learning from demonstrations, the sim2real problem, foundation models in robotics

Mobile robot olfaction - robots with a sense of smell: electronic noses, tasks and challenges in robot olfaction, machine learning for olfaction tasks

When possible, the course will incorporate and discuss recent scientific publications related to the specific topics.

Depending on the interests of the participating students, other topics may be discussed in the course.

Lernergebnisse

After completing of the course students are able to

- describe and compare different ways of representing robot actions
- design and implement action frameworks for a robot
- justify the trade-off between implementing behaviors or skills by hand vs. learning data/interactions them
- understand and explain the capabilities and limitations of robots when performing olfactations tasks
- explain tasks like gas source localization and gas distribution mapping and their associated challenges
- read and understand current scientific literature in robotics

Literatur

There will be reading assignments for different topics handed out during the course, but there is no traditional course book to follow.

Lernergebnisse

With the submission of a Master's thesis and the successful
assessment, students document that they
have understood the teaching content of the previous semesters and
are able to apply it to tasks independently and successfully.

They are able to derive an innovative research question on a selected
research area, which includes a sufficiently
significant and as yet unresearched research field.

They can work on this research question largely independently with an
appropriate and meaningful
research design and lead to an objectively comprehensible, reliable
and valid result.

The written result is at the level of international standards of scientific
publications and, upon
successful completion, demonstrates the competences in terms of
connectivity in the direction of doctoral projects.

Literatur

Is provided based on the topic, but needs also to be
identified by the student as part of the master thesis.

Inhalte

Strong artificial intelligence deals about the question how to design and build human like thought machines. In the course we elaborate the basics of human thinking including naming, numbering, abstracting, conceptualizing and what is needed to build a digital machine that is able to think and act like an individual and is able to interact with other individuals. A variety of interconnected and adopted concepts and theories are necessary to implement human like skills and behaviour. A selection of these, like theory of information, action, time and space as well as a theory of thinking is discussed and developed in the course.
